Unit 19 PHP

الصف الثالث

Unit	19	
Name	PHP Level 1	
Knowledge	Code	Description
	TPK20	writing asynchronous code using various techniques
	TPK21	Basic routing and calling a controller method from a route
	TPK22	Analyze and solve common web applications tasks by writing PHP programs
Skill	Code	Description
	TPC5.1	Use database software tools to run queries and produce reports
	TPC5.2	Write PHP scripts to handle HTML forms
	TPC5.3	Develop and use simple Dashboards and simple data visualization forms

المعرفة	الكود
writing asynchronous code using various techniques	TPK20

Dear learner: Put "True" in front of the correct statement and "False" in front of the incorrect statement.

No	Question	Answer
	PHP is a client-side programming language.	False
	PHP stands for "Hypertext Preprocessor."	True
	PHP can be embedded inside HTML code.	True
	Apache is a programming language used for building websites.	False
	PHP scripts are executed on the server.	True
	The print statement is faster than echo.	False
	PHP variables must start with the \$ symbol.	True
	Variable names in PHP are case-sensitive.	True
	The default file extension for PHP files is .ph.	False
	PHP constants are defined using the define() function.	True
	A PHP variable name can start with a number.	False
	Boolean data type can only have values true or false.	True
	Multi-line comments in PHP use /* */.	True
	The modulus operator (%) is an arithmetic operator.	True
	Logical operators are used to perform mathematical calculations.	False
	The switch statement can replace multiple if...elseif conditions.	True
	The while loop executes at least once, even if the condition is false.	False
	The foreach loop is used to iterate over arrays.	True
	The break statement continues to the next iteration of a loop.	False
	PHP is cross-platform and open source.	True

Dear learner: Choose the correct answer.

No	Question	Answer
	What does PHP stand for? a) Personal Hosting Program b) Hypertext Preprocessor c) Programming Hypertext Pages d) Page Hosting Processor	b
	Which software is a web server commonly used with PHP? a) MySQL b) Apache c) XAMPP d) Node.js	b
	Which extension is used for PHP files? a) .html b) .js c) .php d) .css	c
	PHP code is written inside: a) <php> tags b) <script> tags c) <?php ?> tags d) {} braces	c
	Which symbol is used to declare variables in PHP? a) @ b) \$ c) % d) &	b
	Which statement is faster for output? a) echo b) print c) console.log d) display	a
	Which of the following is not a PHP data type? a) String b) Integer	d

	c) Float d) Character	
	Which operator is used for string concatenation in PHP? a) + b) & c) . d) ,	c
	Constants in PHP are defined using: a) var() b) define() c) const() d) set()	b
	Single-line comments in PHP use: a) <!-- --> b) // c) \$ d) /* */	b
	Which operator assigns values to variables? a) Arithmetic b) Assignment c) Comparison d) Logical	b
	Which loop is best used when the number of iterations is known? a) while b) do...while c) for d) foreach	c
	Which loop executes at least once before checking the condition? a) for b) while c) do...while d) foreach	c

	The break keyword in PHP: a) Skips current iteration b) Stops the loop c) Repeats the loop d) Ends PHP script	b
	The continue keyword in PHP: a) Ends the loop b) Skips current iteration c) Exits PHP code d) Repeats the loop	b
	PHP is mainly used for: a) Mobile apps b) Server-side web development c) Desktop applications d) Operating systems	b
	Which operator is used to check equality in PHP? a) = b) == c) === d) :=	b
	Which operator increments a variable by 1? a) ++ b) -- c) += d) =+	a
	Which version of PHP was popular in 2025? a) 7.4 b) 8.2 c) 5.6 d) 9.0	b
	XAMPP includes: a) PHP, Apache, MySQL b) HTML, CSS, JS c) Python, Django, SQLite d) Windows Server	a

Give the Scientific Name Questions:

No	Question	Answer
	A server-side scripting language used for web development.	PHP
	A free, open-source web server software.	Apache
	Software package that bundles PHP, MySQL, and Apache.	XAMPP
	A variable type that holds sequences of characters.	String
	A PHP statement that outputs content and is faster than print.	echo
	Values in PHP that cannot be changed once defined.	Constants
	A PHP loop used to iterate over arrays.	foreach
	A multi-branch decision-making statement in PHP.	switch
	A PHP data type that represents true or false.	Boolean
	A PHP operator used to concatenate strings.	Dot (.) operator
	Operator used for mathematical operations.	Arithmetic operator
	A PHP statement that stops a loop.	break
	A PHP statement that skips the current iteration.	continue
	Special symbols that perform actions on values.	Operators
	The PHP keyword used to declare fixed values.	define()

Dear learner: Complete the question.

No	Question	Answer
	PHP code is written inside _____ and _____ tags.	<?php , ?>
	PHP variables start with the symbol _____.	\$
	PHP comments that span multiple lines use _____.	/** /
	PHP constants are defined using the function _____.	define()
	The default extension for PHP files is _____.	.php

	To add two variables in PHP, we use the _____ operator.	+
	The output function in PHP faster than print is _____.	echo
	PHP scripts run on the _____ side.	Server
	The _____ statement is used to choose between many conditions.	switch
	The _____ loop runs at least once before checking the condition.	do...while
	To stop a loop completely, we use _____.	break
	To skip one loop iteration, we use _____.	continue
	In PHP, arrays are defined using the keyword _____.	array()

Dear learner: Find the error in the code.

No.	Question	Answer
	<?php \$name = "Ali" echo \$name; ?>	Error: Missing semicolon after ` \$name = "Ali" ` Fix: ` \$name = "Ali"; `
	<?php \$1name = "Ali"; echo \$1name; ?>	Error: Variable name cannot start with a number Fix: \$name1 = "Ali";

المعرفة	الكود
Basic routing and calling a controller method from a route	TPK21

Dear learner: Put "True" in front of the correct statement and "False" in front of the incorrect statement.

No	Question	Answer
	A PHP function is a reusable block of code that performs a specific task.	True
	PHP does not support user-defined functions.	False
	Anonymous functions in PHP must always have a name.	False
	Arrow functions in PHP were introduced in version 7.4.	True
	The strlen() function is used to calculate the length of a string.	True
	The strpos() function finds the last occurrence of a substring in a string.	False
	The strtolower() function converts all letters of a string into lowercase.	True
	The abs() function returns the absolute value of a number.	True
	ceil() always rounds a number down.	False
	The date() function can format and display the current date.	True
	An array can only store one type of value in PHP.	False
	Associative arrays use numeric indexes only.	False
	A multidimensional array contains one or more arrays inside it.	True
	The array_push() function removes an element from the end of an array.	False
	The count() function returns the number of elements in an array.	True

Dear learner: Choose the correct answer.

No	Question	Answer
	Which keyword is used to define a user function in PHP? a) method b) function c) define d) var	b
	What does the str_replace() function do? a) Reverses a string b) Replaces part of a string c) Splits a string d) Finds string length	b
	Which function returns the square root of a number? a) round() b) sqrt() c) pow() d) abs()	b
	Which of the following is a numeric array? a) \$students = ["Ali", "Sara", "John"]; b) \$students = ["name"=>"Ali", "age"=>20]; c) \$students = [["Ali",20],["Sara",22]]; d) None of the above	a
	Arrow functions are mainly used for: a) Multi-line code blocks b) Loops c) Simple, one-line expressions d) Database connections	c
	Which array function adds an element at the beginning? a) array_push() b) array_pop() c) array_shift() d) array_unshift()	d
	Which function gives the number of seconds since January 1, 1970?	b

	a) date() b) time() c) strtotime() d) mktime()	
	Which string function removes whitespace from both ends of a string? a) trim() b) strip() c) clean() d) erase()	a
	What does array_merge() do? a) Removes duplicates b) Combines arrays c) Slices an array d) Reverses an array	b
	Which numeric function rounds up to the nearest integer? a) floor() b) ceil() c) round() d) abs()	b
	In associative arrays, values are stored with: a) Keys b) Indexes only c) Strings only d) None	a
	Which function reverses the order of an array? a) array_reverse() b) array_flip() c) array_merge() d) array_unshift()	a
	strpos("Hello World", "o") returns: a) 2 b) 4 c) 5 d) 6	b

	Which is NOT a built-in numeric function in PHP? a) pow() b) sqrt() c) strlen() d) abs()	c
	Which type of array can contain other arrays? a) Indexed array b) Associative array c) Multidimensional array d) String array	c

Give the Scientific Name Questions:

NO	Question	Answer
106	A block of code that can be reused multiple times in PHP is called a.	Function
107	A function created by the programmer is called a.	User-Defined Function
108	Functions without names are known as.	Anonymous Functions
109	Short one-line anonymous functions introduced in PHP 7.4 are called.	Arrow Functions
110	The function used to calculate string length is.	strlen()
111	The function that finds the position of a substring in a string is .	strpos()
112	To replace part of a string, we use.	str_replace()
113	To round a number upward to the nearest integer, we use .	ceil()
114	The function that gives the absolute value of a number is.	abs()
115	The PHP function that shows the current date is.	date()
116	An array that stores values using numeric indexes is a.	Indexed Array
117	An array that uses named keys to store values is a.	Associative Array

118	An array that contains other arrays is a.	Multidimensional Array
119	The function that merges two or more arrays is.	array_merge()
120	The function that counts array elements is.	count()

121: Match String Functions with their Purpose

No	Functions	No.	Purpose	Answer
1	strlen()	A	Converts to lowercase	1 → c
2	strpos()	B	Replaces part of a string	2 → f
3	str_replace()	C	Returns length of a string	3 → b
4	substr()	D	Removes whitespace from start and end	4 → e
5	strtolower()	E	Extracts part of a string	5 → a
6	trim()	F	Finds first occurrence of substring	6 → d

122: Match Array Functions with their Purpose

No	Functions	No.	Purpose	Answer
1	count()	A	Removes element from start	1 → f
2	array_push()	B	Reverses array order	2 → c
3	array_pop()	C	Adds element at end	3 → e
4	array_shift()	D	Adds element at start	4 → a
5	array_unshift()	E	Removes element from end	5 → d
6	array_reverse()	F	Number of elements in array	6 → b

Dear learner: Find the error in the code.

No.	Question	Answer
127	function greet(\$name) { echo "Hello " \$name; }	Error: Missing dot (.) for concatenation. Fix: echo "Hello " . \$name;
128	\$nums = array("1","2","3"); echo array_pop(\$nums, "4");	Error: array_pop() takes only one parameter. Fix: echo array_pop(\$nums);
129	echo strlen["Hello"];	Error: Wrong brackets . Fix: echo strlen("Hello");
130	\$arr = array("name"=>"Ali", "age"=>20); echo \$arr[0];	Error: Associative arrays require keys , not indexes. Fix: echo \$arr["name"];

المعرفة	الكود
Analyze and solve common web applications tasks by writing PHP programs	TPK22

Dear learner: Put "True" in front of the correct statement and "False" in front of the incorrect statement.

No	Question	Answer
	include() stops the execution of the script if the file is missing.	False
	require() throws a fatal error if the file is missing.	True
	include_once() ensures that a file is included only once in the script.	True
	PHP superglobals \$_GET and \$_POST are always accessible regardless of scope.	True
	The \$_POST method sends data through the URL.	False
	GET requests can be bookmarked because the data is visible in the URL.	True
	POST supports file uploads, while GET does not.	True
	Client-side validation alone is enough to secure forms.	False

	HTML5 attributes like required and type can help in form validation.	True
	Server-side validation is required even if client-side validation exists.	True
	htmlspecialchars() is used to prevent SQL Injection.	False
	MySQL is an open-source Relational Database Management System.	True
	A table is a collection of databases.	False
	CRUD stands for Create, Read, Update, and Delete.	True
	mysqli_connect() is used in PHP to connect with MySQL databases.	True

Dear learner: Choose the correct answer.

No	Question	Answer
	Which function includes a file and continues execution even if missing? a) require() b) include() c) include_once() d) require_once()	b
	Which function throws a fatal error if the file is missing? a) require() b) include() c) echo() d) isset()	a
	To prevent duplicate file inclusion, you use: a) repeat() b) require() c) include_once() d) addfile()	c
	Data sent using GET appears: a) In the request header b) In the request body	c

	c) In the URL d) Hidden in session	
	Which is true about POST? a) Limited length b) Appears in URL c) Cannot send files d) Supports binary data	d
	Which method should NEVER be used to send passwords? a) POST b) GET c) COOKIE d) SESSION	b
	Client-side validation is usually done with: a) PHP b) MySQL c) JavaScript d) SQL	c
	Which attribute in HTML5 enforces mandatory input? a) mandatory b) required c) must d) validate	b
	Which function prevents XSS by converting < to &lt;? a) htmlentities() b) htmlspecialchars() c) strip_tags() d) sanitize()	b
	Which PHP extension is used to connect to MySQL? a) mysql_old b) mysqldb c) mysqli d) mysqlphp	c
	In MySQL, a single entry in a table is called: a) Column	c

	b) Field c) Row d) Query	
	Which CRUD operation retrieves data? a) INSERT b) UPDATE c) SELECT d) DELETE	c
	Which CRUD operation removes records? a) DELETE b) DROP c) REMOVE d) TRUNCATE	a
	Which CRUD operation adds new records? a) INSERT b) UPDATE c) CREATE d) NEW	a
	The default MySQL port is: a) 80 b) 443 c) 3306 d) 8080	c

Give the Scientific Name Questions:

No	Question	Answer
	A PHP function that includes a file but continues execution even if missing.	include()
	A PHP function that includes a file but throws a fatal error if missing.	require()
	A PHP superglobal that collects form data sent via URL parameters.	\$_GET
	A PHP superglobal that collects form data sent via HTTP POST.	\$_POST

	Validation that happens before the form is submitted to the server.	Client-Side Validation
	Validation that happens after the form is submitted.	Server-Side Validation
	A function that prevents XSS by converting special characters to HTML entities.	htmlspecialchars()
	A widely used open-source relational database management system.	MySQL
	A structure that holds related data in rows and columns.	Table
	A single entry (record) in a database table.	Row
	A command used to retrieve, insert, update, or delete data.	Query
	The operation in CRUD that modifies existing records.	Update
	The operation in CRUD that removes records.	Delete
	The PHP function used to connect to MySQL.	mysqli_connect()
	A database management feature that ensures consistency and reliability of stored data.	Data Integrity

176: Match PHP Functions with Behavior

No	Functions	No	Behavior	Answer
1	include()	A	Converts special characters to HTML entities	1 → c
2	require()	B	Includes file, fatal error if missing	2 → b
3	include_once()	C	Includes file, warning if missing	3 → d
4	require_once()	D	Includes file only once, warning if missing	4 → f
5	htmlspecialchars()	E	Connects PHP to MySQL	5 → a
6	mysqli_connect()	F	Includes file only once, fatal error if missing	6 → e

177: Match CRUD Operations with Description

No	Column (A)	No.	Column (B)	Answer
1	INSERT	A	Retrieves data	1 → b
2	SELECT	B	Adds new data	2 → a
3	UPDATE	C	Removes records	3 → f
4	DELETE	D	Creates a new database	4 → c
5	CREATE DATABASE	E	Deletes a table	5 → d
6	DROP TABLE	F	Modifies existing data	6 → e

Dear Learner: Answer the following questions.

	Question	What is the main difference between GET and POST?
	Answer	GET sends data in the URL, POST sends data in the request body (hidden).

	Question	Why should sensitive data not be sent using GET?
	Answer	Because it appears in the URL and can be stored in browser history or logs.

	Question	What is the purpose of server-side validation?
	Answer	To ensure data accuracy and security even if client-side validation is bypassed.

	Question	What does htmlspecialchars() prevent?
	Answer	Cross-Site Scripting (XSS) attacks.

	Question	What does CRUD stand for?
	Answer	Create, Read, Update, Delete.

	Question	What is a row in a database table?
	Answer	A single record (entry) representing one set of related data.
